Nursing is a scientific cluster that focuses on individuals, families, and communities, both healthy and sick people. To achieve satisfaction in providing nursing care, the quality of care and critical thinking related to complaints and needs from patients need to be considered by nurses. Nursing is a holistic science that studies the needs of both health and illness. Problems experienced by patients are something that must be resolved by nurses. For this reason, research related to problems experienced by patients is a concern. In the clinical setting, nurses can find out the patient's condition for

24 hours by dividing the shift. The family that is felt or the patient or the intervention given has not been able to solve the problem. The nurse can conduct research related to this. One of the roles of the nurse is as a researcher. In clinical settings, Research and Development (R&D) can be done. Nurses have a crucial role in publishing to find the best solution to the problems experienced by patients. However, nurses who work in clinical settings are less likely to do research. This is a concern that needs attention.
